Aging - a multi-dimensional process: translation from human to models

Vered Raz

Human Genetics

Leiden University Medical centre

When	What: Animal models on ageing	Who	Where
13.30-14.00	Lecture: aging process and models	Vered Raz	
14.00-15.30	Self Study: Mouse model of Ageing	You	
15.30-17.00	Mouse model of Ageing: Presentation and Discussion	You	

- A multifactorial process
- Aging
- Models: human, animals or cellular

What is a multifactorial process?

- **Spatial**
 - Systemic: all tissues are involved
 - vs
 - A tissue-specific involvement
- **Temporal (time-dependent)**
 - Age of onset
 - An age-associated pattern
 - Progression: linear or non-linear
- **Molecular (regulators vs. signatures)**
 - Key regulators vs. multiple regulators
 - Key cellular processes vs. multiple processes

What is a multifactorial process?

- **Spatial**
 - Systemic: all tissues are involved
 - vs
 - A tissue-specific involvement
- **Temporal (time-dependent)**
 - Age of onset
 - An age-associated pattern
 - Progression: linear or non-linear
- **Molecular (regulators vs. signatures)**
 - Key regulators vs. multiple regulators
 - Key cellular processes vs. multiple processes

Prediction models

Aging – definition(s)

Aging – definition(s)

Evolutionary biology:

1. An age-dependent or age-progressive **decline in intrinsic physiological function**, leading to an increase in age-specific mortality rate and a decrease in age-specific **reproductive rate**.
2. an age-progressive loss or de-tuning of **fitness (natural selection)** or the *state of adaptation*.

Britannica:

Progressive physiological changes in an organism that lead to a **decline of biological functions** and of the organism's ability to adapt to metabolic stress (senescence).

Senescence: A biological process of growing older in a deleterious (harmful) sense.

Medical: The process of becoming older, a process that is genetically determined and environmentally modulated leading to an increase in disease risk.

WHO:

Biological: a process that is genetically determined and environmentally modulated.
Social: life transitions (causes and/or triggers)

Aging in human

Evolutionary biology:

1. An age-dependent or age-progressive **decline in intrinsic physiological function**, *leading to a decrease in social function and overall activity.*
2. an age-progressive loss or *de-tuning adaptation.*

Britannica:

Progressive physiological changes in an organism that lead to a **decline of biological functions** and of the organism's ability to adapt to metabolic stress (senescence).

Senescence: A biological process of growing older in a *deleterious (harmful?)* sense.

Medical: The process of becoming older, a process that is genetically determined and environmentally modulated leading to **an increase in disease risk. – what about the elderly who are active and healthy?**

WHO:

Biological: a process that is *epi*-genetically determined and environmentally modulated.
Social: life transitions (causes and/or triggers)

Aging- a multifactorial biological process

Aging- a multifactorial biological process

Onset

When onset start?

Diagnosis (Biomarkers?)

How to study?

- Chronological age?
- Molecular age?
- Metabolic age?

progression

- Cellular degeneration
- Tissue degeneration
- Organ function
- Tissue and organ communication

Aging- a multifactorial biological process

Aging: An increase in disease risk

Aging-associated chronic disorders in the general population

Adult-onset hereditary disorders

Healthy

Aging-associated disorders

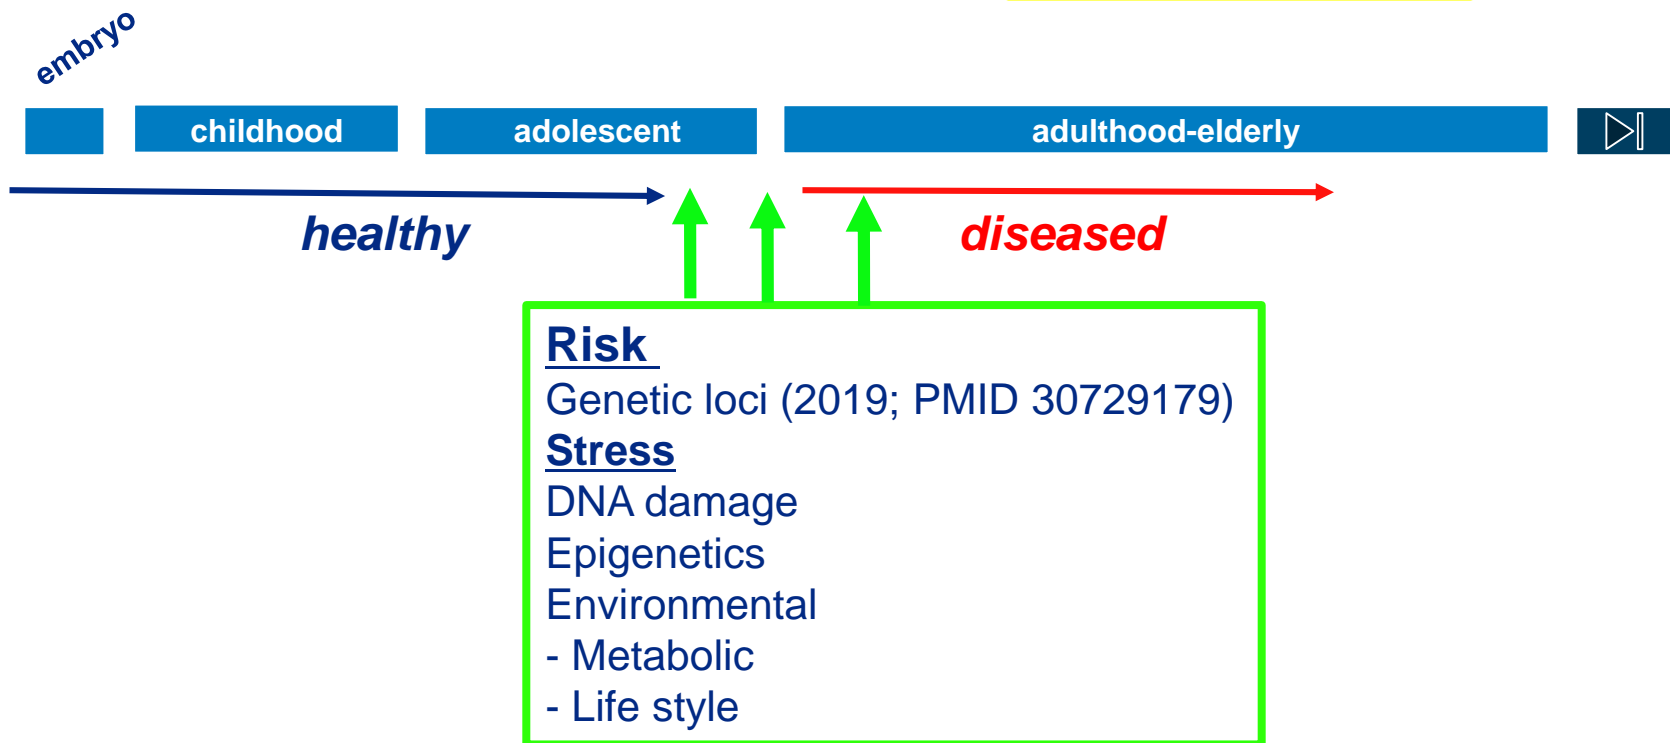

Hereditary

Mutations: germline

Non-Hereditary

Spontaneous

- de novo
- sporadic

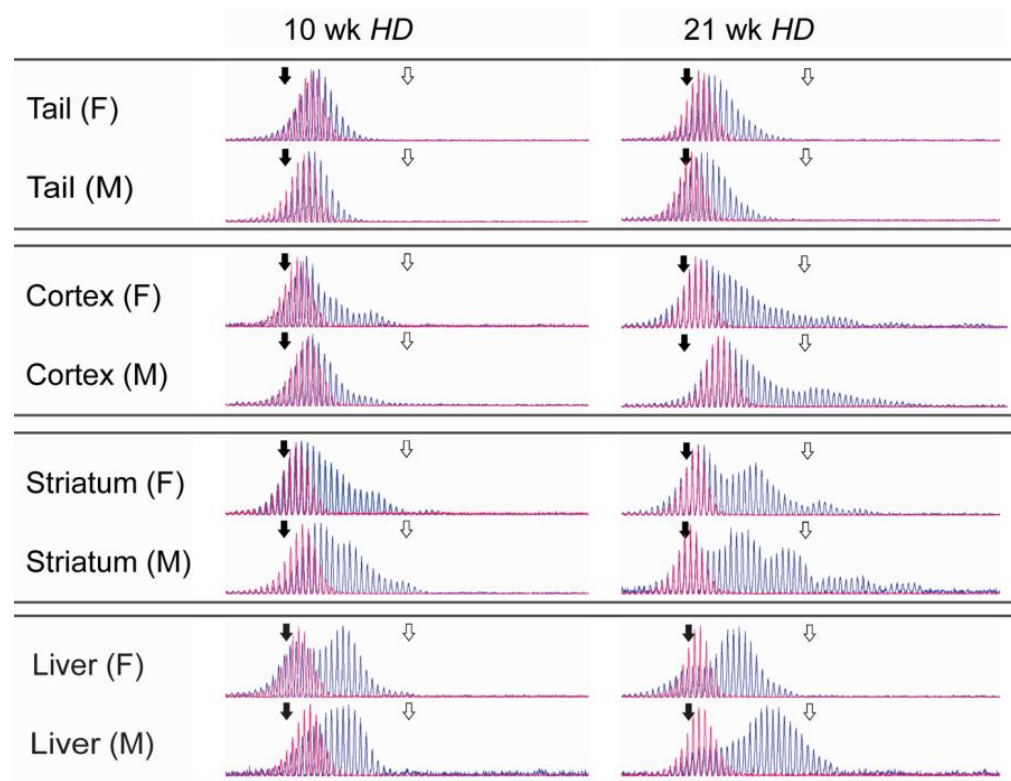

An Age-associated genomic instability

DNA damage

Modified from
Andrii I. Rozhok & James DeGregori

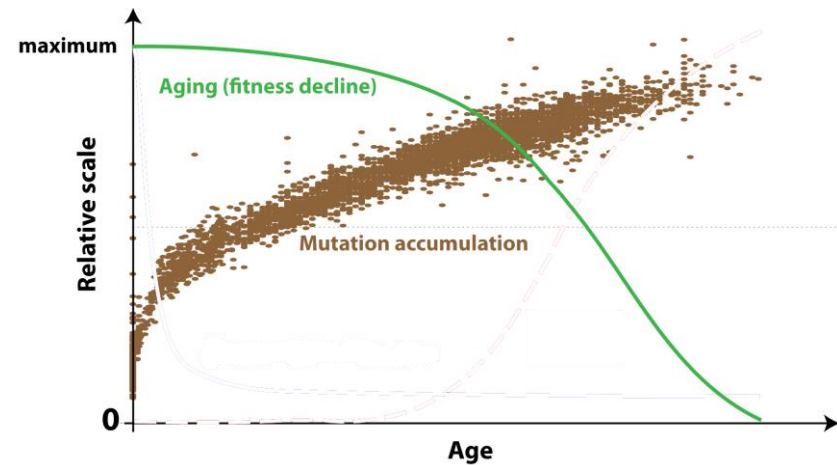

Age-associated somatic instability

Møllersen et al., PLoS Genet 2010

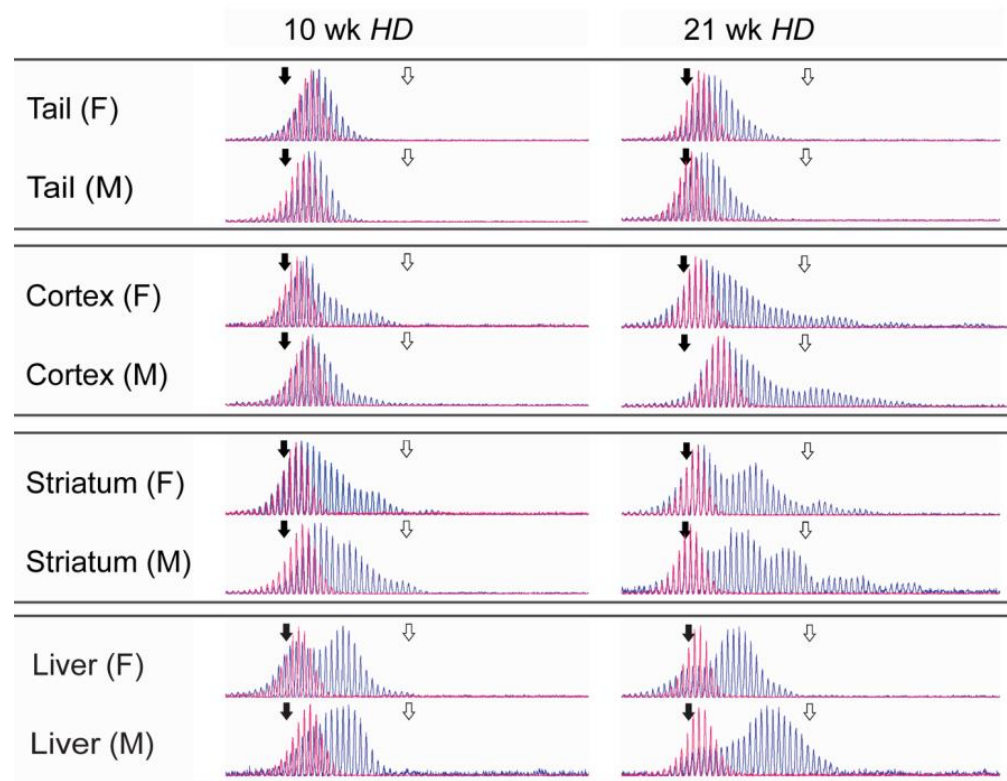

An Age-associated genomic instability

DNA damage

Modified from
Andrii I. Rozhok & James DeGregori

Age-associated somatic instability

Tissue-specific somatic instability

Møllersen et al., PLoS Genet 2010

Tissue specific age-associated changes

A. Lateral and orbito-frontal cortex

B. primary visual cortex

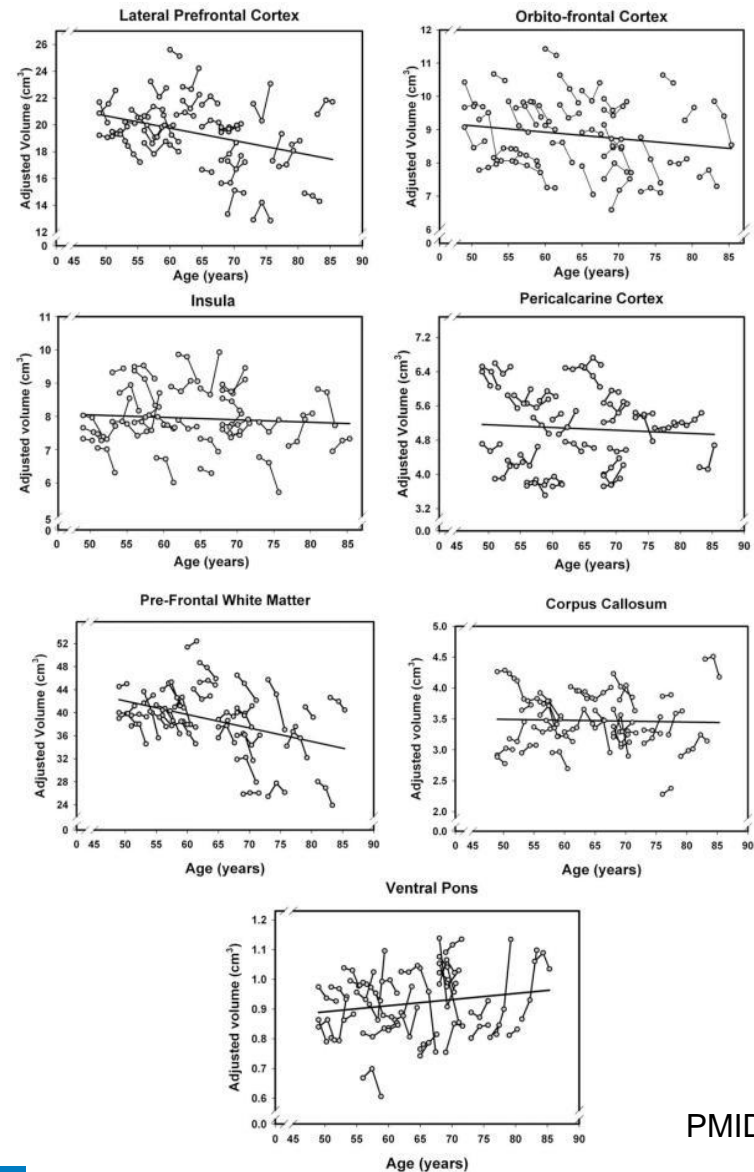

C. insula

D. hippocampus

E. entorhinal cortex

Study design:
Healthy individuals
Longitudinal MRI scan (2-3 per subject)
Age-range: (48-87)

PMID: [20298790](https://pubmed.ncbi.nlm.nih.gov/20298790/)

Tissue specific age-associated changes

A. Lateral and orbito-frontal cortex

B. primary visual cortex

C. insula

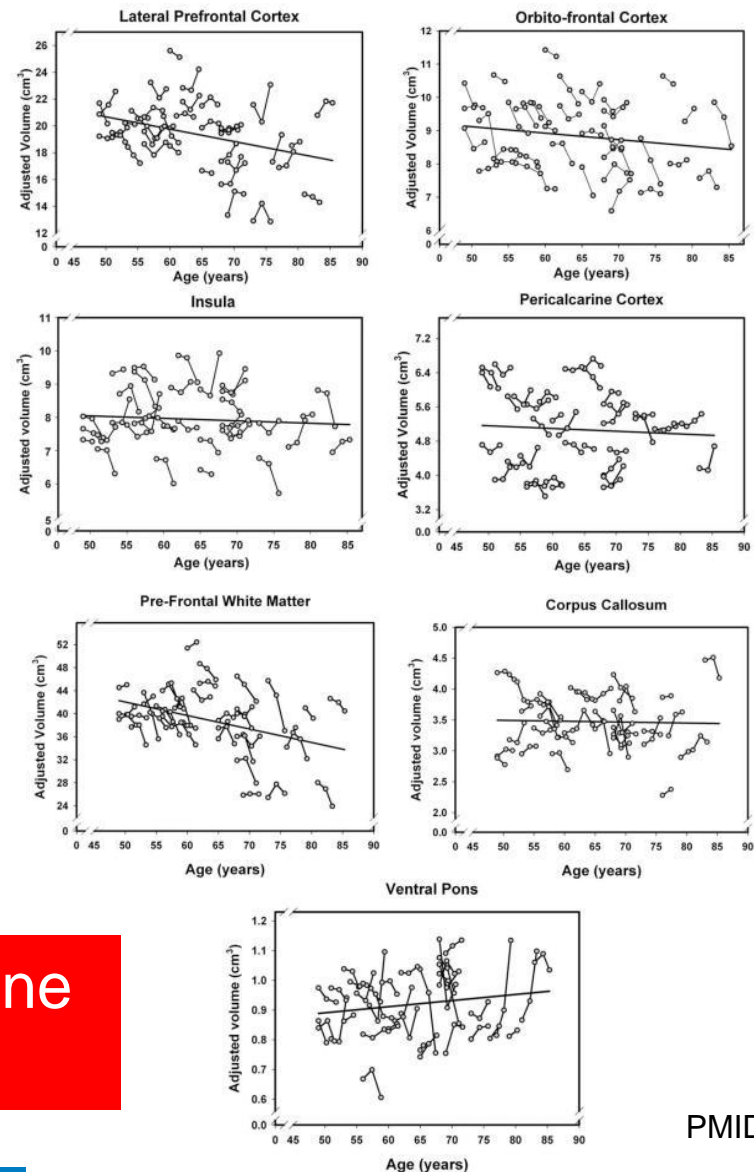

D. hippocampus

E. entorhinal cortex

Study design:
Healthy individuals
Longitudinal MRI scan (2-3 per subject)
Age-range: (48-87)

A tissue-specific functional decline within the human brain

PMID: [20298790](https://pubmed.ncbi.nlm.nih.gov/20298790/)

Age-associated shoulder diseases

I'm 20 years old.
At my age, rotator cuff tears
very uncommon. So if its seen
on an MRI
its probably from a sports injury.

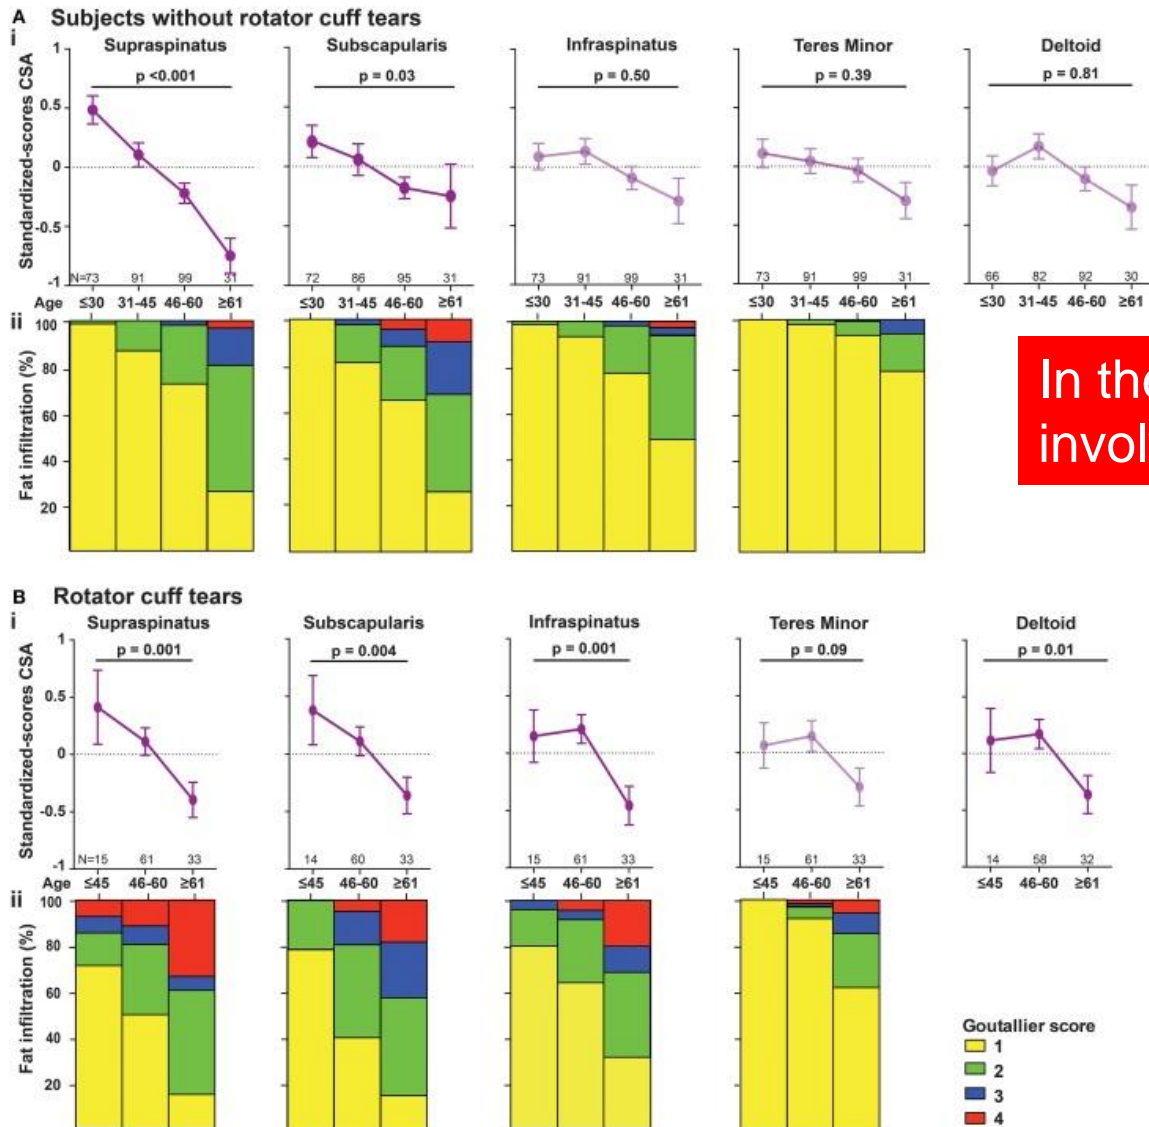

I'm 75 years old.
Me and most of my friends
have a rotator cuff tear.
It comes with aging.
The pain comes at night
but anti-inflammatories help.

PMID: [26733863](https://pubmed.ncbi.nlm.nih.gov/26733863/)

Progression of RC tear is age-associated

In the shoulder joint, muscle involvement is age-associated

What is a multifactorial process?

- **Spatial (MRI)**
 - All tissues or
 - **A tissue specific involvement**
- **Temporal**
 - Age of onset
 - Age-associated pattern
- **Molecular**
 - Key regulators vs. multiple regulators
 - Key cellular processes vs. multiple processes

Prediction models

Large dataset (omics) - statistics

The *globaltest*: determine whether a global expression pattern of all genes or a group of genes is significantly related to a feature, such as disease, clinical feature, biological pathway or physiological condition.

J. Goeman

The *globaltest* in cross-sectional RNA microarray

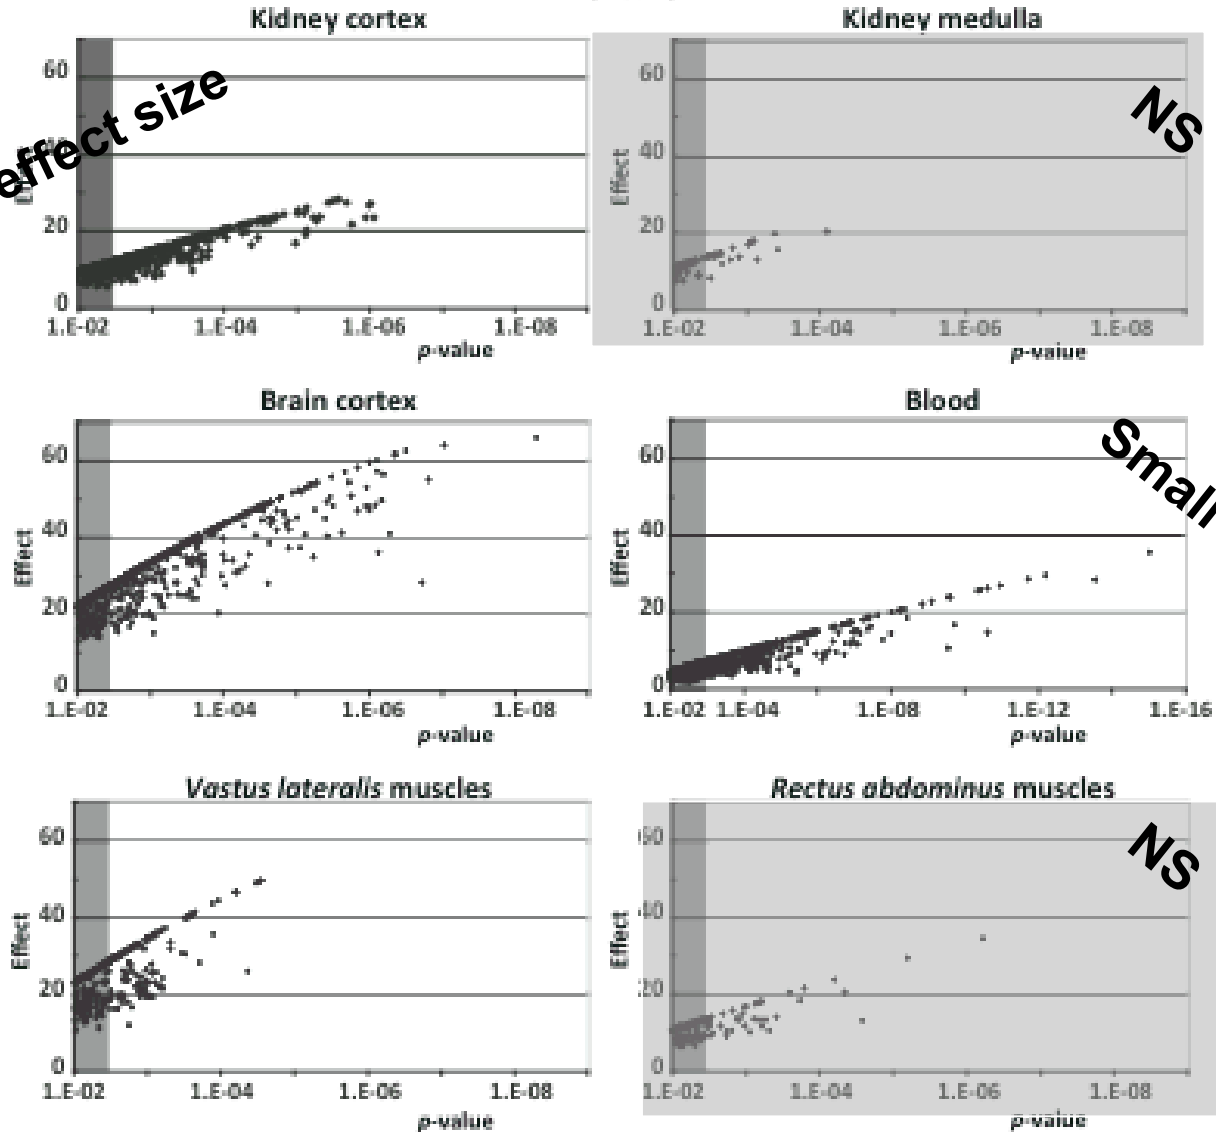

Tissue	Nr of samples	Age range	P-value	Effect size			%Age-regulated genes*	%Age-regulated KEGG pathways
				Statistics	Expected	SD		
Whole blood	150	42-102	0.001	1.28	0.68	0.10	22.0	69.4
Kidney cortex	70	27-92	0.002	4.25	1.42	0.59	13.3	69.0
Brain cortex	30	26-106	0.004	8.96	3.57	1.35	23.5	58.2
<i>Vastus lateralis</i> muscles	29	35-89	0.015	5.52	3.70	0.68	11.7	52.3
Kidney medulla	60	29-92	0.150	2.27	1.72	0.57	5.5	7.0
<i>Rectus abdominis</i> muscles	62	24-83	0.247	2.00	1.67	0.78	5.9	5.3

The choice of the model system

Which model to choose?

Every group gets a different an aging-related assignment:

- Describe the ageing-associated condition (problem): consider tissue specificity, age of onset, progression.
- Discuss potential models for the condition and the tools to develop potential option(s) to study it in order to develop therapy.

Aim: to find the fastest and least expensive path to develop a therapy

Aid: Attached literature

Conditions:

- Sarcopenia :reduced muscle function: muscle weakness and atrophy
- Dementia: reduced cognitive capacity with age
- Autoimmune disorders: reduced ability to distinguish self from nonself (identification of foreign antigens)
- Arthrosis: Degeneration of connective tissues
